## Sprint 1 Review Document

#### Team 16

**Andrew Davis** 

Kyle Krynski

Paul Ryan

Tejaswi Namuduru

Zening Chen

#### Successful

User Story 1: As a user, I would like to be able to manage my personal account and information within the app.

- Users can create a new account with a username and password, login, and logout. Both the Android app and the Baasbox server are notified of these changes.
- The app will not allow a user to continue to main functionality before logging in.
- The front-end interface for managing details such as phone number and email of a user's account is constructed, but not implemented in the app.
- User can have a list of view of the groups he/she involved in .
- The model object for a user is created.

User Story 2: As a user, I would like to be able to create a group.

- Users can create a group with a specific interface to input the name, description, and privacy level. The activity creates a local instance of the group that is linked with a created server instance.
- The model object for a group is created.

User Story 3: As a user, I would like to be able to add specific acquaintances or people to the group I am creating.

- Users can navigate to an interface that allows for the search of other users, as well as a display of the results.
- The interface for editing and adding users to a group is designed and coded.

User Story 4: As a user, I would like to be able to select and search which groups I would like to become a part of in the future.

• Users can navigate to an interface that allows for the search of public groups, as well as a display of the results.

#### Unsuccessful

User Story 1: As a user, I would like to be able to manage my personal account and information within the app.

- The interface for user's profile management is not part of the application yet, it is only coded.
- The user cannot manage their profile information on the server or within the application.

User Story 2: As a user, I would like to be able to create a group.

 The user cannot view the group that they create after they create it. The update is only on the server, as the application does not have the functions to display these updates yet.

User Story 3: As a user, I would like to be able to add specific acquaintances or people to the group I am creating.

The user cannot actually add anyone to a group yet.

User Story 4: As a user, I would like to be able to select and search which groups I would like to become a part of in the future.

- The server will not be notified when searching.
- The responses from the server cannot yet be handled.

User Story 5: As a organization leader, I would like to be able to find all people interested in my group.

• The is no functionality or designed code that allows group leaders to find users who are interested in joining their group.

### **Improvements**

- 1. Rather than work individually, we should spend more time working and meeting together. Also, instead of having long duration meetings, we have decided to split up our meetings, which will contribute to our ability to solve problems.
- 2. We need to understand the link between the objects that we have in the application and how they are stored, handled, and retrieved by Baasbox in more detail. It is hard to design functions of the application without understanding the data objects.
- 3. In order to have a more unified idea of how all of the systems of the application work, we need to communicate our ideas more often on the theory behind what we are doing.

4.	The code that we write needs to be organized and commented much more thoroughly. It is hard to keep up with all of the methods if the comments are lacking.
